Estimated Serving Time

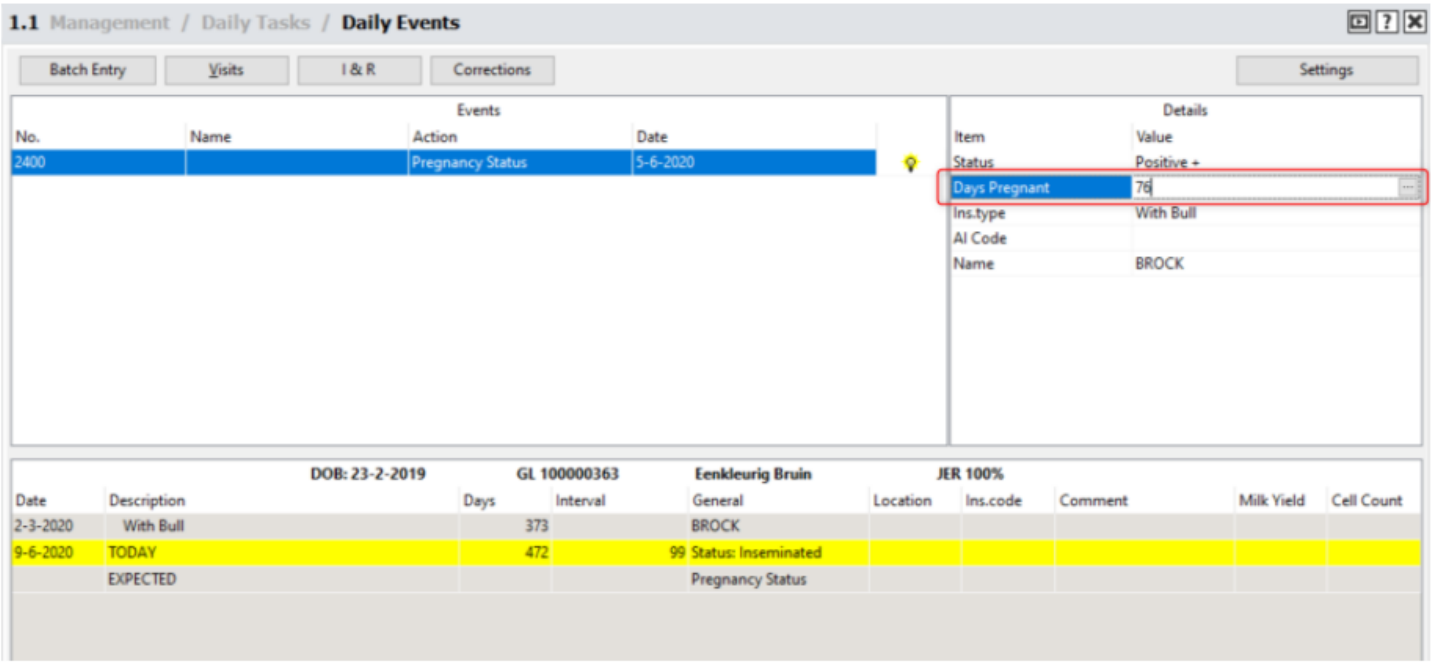

Fertility & reproduction · https://www.uniform-agri.com/knowledge-base/dairy/fertility-reproduction/estimated-serving-time/

In UNIFORM it is possible to let the program make an estimated serving date, when a cow for example has been with a bull. This estimated serving date will be added when in **daily event** the cow will be declared pregnant. For doing this, there are a few steps to take:

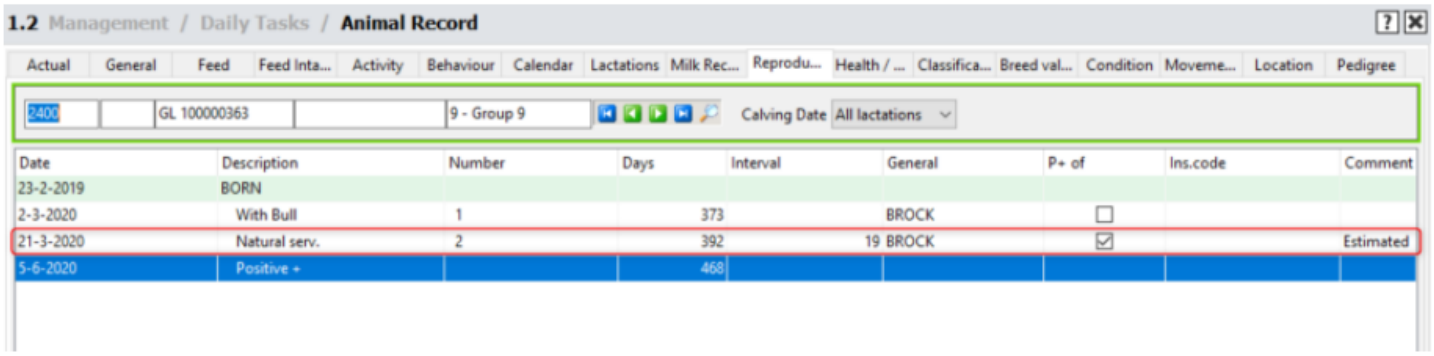

First check if the following setting is active: **[Ask for days in calf when PD+]**.

In this example an animal has been with a bull. Next there has been a **pregnancy check**. She is pregnant and at the **Daily Event** this will be inserted. The program asks for the amount of days the animal is pregnant and if this will be inserted, the program is making an **estimated serving**.

On the **animal record** the **estimated serving** is added, shown in the following picture:

The advantage of this is that the animal will get a more accurate **estimated calving date**.
